

Green Mountain Sugar Maple

Sugar maples are a Midwest native loved for their exceptional fall color. In summer, its lustrous foliage provides excellent shade, making it a great choice for parks, golf courses, and home landscapes where its roots can spread. Handsome upright, oval shape. Adaptable to moderately high pH; tolerant of heat and dry conditions. Dark green leathery foliage that turns orange and golden yellow during fall. Its thick leaves are resistant to leaf scorch.

Reaches 50-60 feet high; 45-50 feet wide.

Full Sun to Partial Shade

Low trickle base to the root zone every other day for the first 2 weeks. Weaning to every 3rd week 1x per month; supplementing during times of drought.

Avoid pruning in early spring as maples are “bleeders” and will lose large amounts of sap.

- Do provide adequate drainage and avoid “clay bowls” that are notorious for holding water and predisposing plants to the compost heap.
- Do apply mulch to a depth of 3-4”, your mulch ring should be the same diameter as the canopy above. Avoid piling the mulch around the trunk and creating the unfortunate “mulch volcano”.

- Don’t forget to do an annual inspection looking for any deadwood or damage seasonally.
- Don’t plant too deep; pay attention to the root flare in relation to the surrounding grade. A tree too high or deep will result in a tree under stress.
